Project Title: <u>Car Rental Web application System</u>

Introduction

This application is web based application system that will bring the solution for the tourist in my country and also some other people need to rent a car in local (or in country) such as people who have the weeding and some other events that required people to use cars.

As the goals of my project is to:

➢ Connect people that have cars to rent and people that what the cars to use.
➢ Improve the advertising or people's cars in order to be known by the people need it for rent.

This application will provide some benefits to different people such as End-user who is the people who what car to rent and people that have the cars to rent also will benefits from system by publishing their cars on public in order to be known by people which will rise their car clients, and also as the owner of system I will have profit form the people that will post their cars on the platform.

Expected features

This system expect to have different features that are listed below:

Features on side of End-user or Clients of Cars, people who rents the cars

➢ Visiting web page to see the cars posted.
➢ Book cars based on their choose.
➢ Sending inquiry to the car's owner.

Features on the side of the owner of cars (partners in system).

➢ Creating account in order to continue other activities and Login.
➢ Posting their cars on the platform.
➢ Approve the car booking on their cars or reject.
➢ Get inquiry from clients.

Market survey

Most of the web that are already running, have the same features as my project. There is no much difference with my project. But I got some idea from that those web sites about how the contents arranged on the site and how activity follow each other.
